Familiness and Born Globals: 
Rapid Internationalisation among Polish Family Firms

Abstract: Rapid internationalisation is a very popular research theme internationally. Verifying the links between familiness of the investigated firms and the accelerated internationalisation among Polish family firms can be very promising. The objective of the paper is to identify the rapid internationalisation path of Polish family firms while going international from the comparative perspective of the familiness. The paper presents the research results of the survey conducted in the turn of 2013-2014 among 216 firms, including 88 family businesses. Based on the calculations we can assume that the average time of internationalisation measured from the establishment is the longer in case of family firms than non-family firms. It can be with the line to the statement that born globals are more frequently met among non-family firms.

Key words: born global, internationalisation, international entrepreneurship, small and medium-sized enterprises, family firms, family entrepreneurship

Introduction

On the average in the EU just about 71% of all businesses can be regarded as family firms [Surdej, Wach 2010, p. 108-109], the highest ca. 90% or more in Cyprus, Estonia, Spain, Germany, Italy and the lowest ca. 35% in Latvia, Lithuania and Poland. However, it is estimated that in Poland, family businesses constituted from 35% (prudent estimates) to about 70-80% (optimistic estimates) of the total number of Polish firms [Surdej, Wach 2011, p. 5, pp. 135-136]. Family businesses are

one of the most important sources of wealth generation and employment growth in the contemporary world. More and more researchers would like to explore and explain the phenomenon of family firms and their role in the economy. Family business (FB) has been regarded as a separate scientific field since 1990s [Shi 2014, p. 3]. It has its prestigious international journals, book series and scientific associations. Nevertheless, various researchers representing various scientific disciplines ad hoc undertake the research on family businesses from the different perspectives, mainly from macroeconomics (role of FBs in economic growth and development), management (ownership and coordination of the FBs) and entrepreneurship (the role of family as the entrepreneur, family entrepreneurship). In the literature there is a definition dilemma and the terms such as family business (FB), family firm (FF), family-controlled firm (FCF), family-owned business (FOB) are used [Shi 2014, p. 3; Litz 2008, p. 218], however the most accepted approach distinguishes the Three-Circle Model linking the family, the ownership and the management [Davis, Taguiro 1982; Jaffe 1990; Cohn 1992, Hatten 2003; Surdej, Wach 2012; Więcek-Janka, 2013].

Since over two decades scientists all over the world have been trying to explain international aspects of family business [Popczyk 2013; Zaniewska 2012; Kontinen, Ojala 2010; Hadryś-Nowak 2014; Wach & Wojciechowski, 2014; Daszkiewicz & Wach, 2014; Daszkiewicz, 2014]. The objective of the paper is to identify the rapid internationalisation path of Polish family firms while going international from the comparative perspective of the familiariness. The paper presents the research results of the survey conducted in the turn of 2013-2014 among 216 firms, including 88 family businesses.

**Theoretical Background of the Rapid Internationalisation: Born Globals**

Already in 1989 an Israeli researcher J. Ganitsky noticed innate exporters on the basis of his research conducted in Israel [Knight, Madsen, Servais 2004, p. 649]. It is reported that the born globals were first identified in the early 1990s in Australia in a report prepared by McKinsey & Co [1993]. As a result of the research results the economist S.T. Cavusgil [1994a; 1994b] announced the end of the era of stages models. The above mentioned report defines a born global as a firm which from the inception perceives the world as its marketplace, hence the foreign markets are not addenda to the domestic market [Wach 2012; Wach 2014]. The report identifies two groups of exporters – traditional exporters and small business born globals. The latter within two years of their launch achieved 76% of their revenues from exports, while their average age was 14 years old, and together these companies provided 20% of Australian exports [Rennie 1993, p. 46].

One of the first quoted definition of born globals can be found in G.A. Knight and S.T. Cavusgil [1996 quoted in Persinger, Civi, Walsh, Vostina 2007, p. 74]. Gen-
erally born globals are defined as small businesses with fewer than 500 employees whose annual turnover does not exceed 100 million USD, and the share of exports (one or several of its products) is at least 25% of the total production volume during the first two years. A similar definition can be found in later studies, for example it is most often reported that born globals in the first two or three years of operation generate at least 25% of the total turnover of the business in foreign markets [Knight, Madsen, Servais 2004, p. 649; Moen 2002, p. 158]. A lot of controversy to the definitions of born globals being the hackneyed and duplicated in different studies, are arisen in the literature, however stressing that they are appropriate only for highly developed economies, and having little adequate for emerging markets and developing economies [Persinger, Civi, Walsh, Vostina 2007; Lopez, Kundu, Ciravegna 2009].

B.M. Oviatt and P.P. McDougall [1994] created of the concept of international new ventures (INV), which de facto gave rise to the emergence of international entrepreneurship as a separate academic discipline. The international new venture is a business organisation that from the inception tries to gain a significant competitive advantage from the use of resources and sales in many countries [Oviatt, McDougall 1994, p. 49]. The INV concept is readily apparent from the adversarial over conventional stages models. The main difference relates to the process of internationalisation of the firm per se, which runs here faster and more aggressively, and firms can bypass conventional fixed stages of internationalisation. It is worth noting that B. M. Oviatt and P.P. McDougall in their assumptions did not specify the exact moment of the internationalisation of international new ventures, and incidentally identified four types of such ventures [1994, p. 59]:

- an export / import start-up meaning the internationalisation of the firm engaged in the trade on few markets in the slight need for coordination of activities in these markets, except for logistics,
- a multinational trader specifying a trader operating in many markets, however, mainly in the form of exporting and importing, while the more markets it operates in, the more needs to intensify the coordination of activities,
- a geographically focused start-up, which means the firm internationalised on a scale of a region of the world, using tacit knowledge to build a competitive advantage difficult to imitate, which can be identified with the later developed in the literature the concept of born regional [Lopez, Kundu, Ciravegna 2009],
- a global start-up, which is a pure form of a born global.

Firms classified in the first two categories of international new ventures are known as the creators of a new international market. These are traditional firms that focus primarily on the export and import in several or many foreign markets. The theory of international new ventures is sometimes also referred to models of instant internationalisation, internationalisation at founding, or the theories of
early internationalisation. International new ventures seek to gain a niche in the
global market, where they get to use more effective strategies for internationalisa-
tion [Hallbäck, Larimo 2007, p. 42]. As a rule, already in the initial stage they act
simultaneously on several or even many markets. The process approach can be
recognised in the development through these four ventures, due to the transition
between the four types of ventures highlighted by Oviatt and McDougall. It occurs
also that the firms from the beginning are born globals (as one of the four types).

**Methodological Assumptions of the Empirical Research**

The research objective of the paper is to identify the rapid internationalisation
path of Polish family firms while going international from the comparative perspec-
tive of the familiness and to explore the born globals among investigated family
firms. In the course of the study, the following research hypotheses were assumed:

H1: The average time of internationalisation measured from the establishment
is the same for family and non-family firms.

H2: Born globals are more frequently met among non-family firms.

The two main research methods were applied: literature review, its critics and
synthesis as well as the survey. The questionnaire (a telephone conversation request
followed by an e-mail with the online password-protected questionnaire) was sent
to 6000 Polish firms being listed in the database of Polish exporters. The survey
was conducted between October 2013 and February 2014 (Wach & Wojciechowski,
2014; Daszkiewicz & Wach). However the return of questionnaires was 248 firms,
nevertheless to further statistical analysis only 216 firms, including 88 family firms
could be accepted (fig. 1). The survey questionnaire, having 27 complex questions,
was divided into four parts:

1. characteristics of the firm,
2. characteristics of the entrepreneur being an owner or a principal manager,
3. characteristics of the business industry,
4. patterns of business internationalisation.

The statistical calculations were made by means of the statistical software pack-
age “Stata/SE 12.0”. Pearson’s chi-square independence test as well as test compar-
ing two means were applied in order to verify the assumed hypotheses.
Empirical Results and Discussions

Four out of ten investigated firms internationalise according to the traditional path, while six firms internationalise much faster and use the rapid internationalisation path (fig. 2). This relation is a bit higher on the plus of born globals\(^2\) for non-family firms. Slightly less than half of family firms use traditional and slower path of the internationalisation. By testing differences between two means \(z = 2.853 > 1.644\), it can be proved that family firms internationalise longer than non-family firms (table 1, table 2).

Born globals are understood in here as firms, which internationalise within 3 years after the establishment.

Source: Own study based on the research results (Nfamily=88)

There is a relation between the size and speed of internationalisation (chi2 = 144.4564, df = 120, p = 0.064). However the results can be controversial as we don’t know the size when they internationalized (only the current size). The fastest internationalisation, that is in the year of establishment, occur among medium-sized and microenterprises as well as large enterprises (fig. 3). After one year from the establishment the internationalisation was very popular among small firms. Altogether 76 out of 216 firms were internationalised from the inception (31 firms after a year, 14 after 2 consecutive years, 8 after three years and 11 firms after 4 years).

In the questionnaire the responders were asked to determine which of the four basic strategic approaches are used. There were four descriptive options (fig. 4), which later on were transformed into a clear names of the strategies. The statistical calculations (chi2 = 14.5950 df = 3, p = 0.002) prove that there is a dependence between the familiness of the investigated firms and their strategies (fig. 5). Traditional internationalisation is the most popular among family firms, while born regionals and born globals\(^3\) are more often met among non-family firms.

\(^3\) Born globals are understood in here as firms that declare such a status based on the description choice.
Conclusions

Some basic conclusions based on the survey results and statistical calculations can be drawn up, however they must be treated as a kind of very initial poll results only. Nevertheless, further detailed research using a much wider sampling of internationalised family firms is needed in order to present more detailed and precise conclusions.

The hypothesis H1 was rejected as it was proved that the average time of internationalisation measured from the establishment is longer in case of family firms than non-family firms. On the average the investigated family firms internation-
alised within 9 years since the establishment. It can be with the line to the hypothesis H2, which was proved, stating that born globals are more frequently met among non-family firms. It is just against the research conducted in Poland by W. Popczyk [2013, p. 10 and 215], however on a peculiar sampling of companies listed on NewConnect, so they are not representative for all Polish family businesses.
